

Measuring Doors

Door Surrounds are comprised of a Pilaster Kit and a Header plus Keystone.

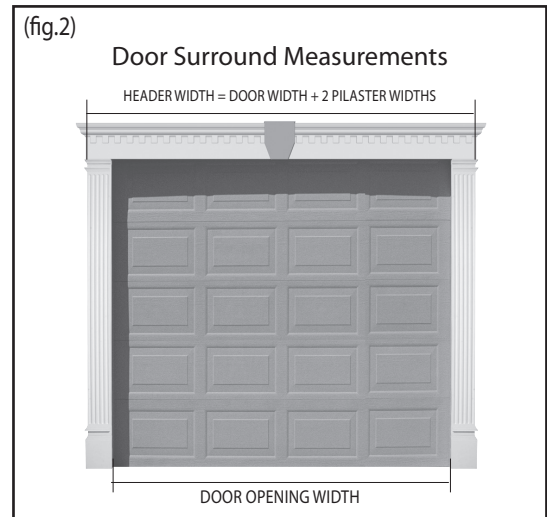

The Pilaster comes in one size: 96" / 8 feet (2438mm) long. It can be cut to fit the door exactly.

The only measurement that you need is for the header.

Note: Header width indicates the width along the base of the header.

Determine the Header Width

- A. Measure door opening width as shown in fig. 2. Remember to include the frame in your measurement.
- B. Add the width of the pilaster two times ($6 \frac{7}{8}" \times 2 = 13 \frac{3}{4}"$) (174.5 mm x 2 = 349mm) to the above width measurement.
- C. The final number is the header width for the door surround.

When measuring the width of your door be sure to include the frame.
